# Investigating the Influence of Prenatal Metals Exposures on Childhood Exposures on Mitochondrial Biomarkers

**NAME: Z'DHANNE WILLIAMS**

**MENTOR: DR. ALLISON KUPSCO**

# Background

- **Mitochondrial DNA** (mtDNA) can indicate biological conditions because changes depending on stress conditions.
- The mitochondrial DNA Copy Number (mtDNAcn) is a **measure of mitochondrial genomes** content per cell and can reflect mitochondrial function.
- Cell-free mtDNA Copy Number (cf-mtDNA) refer to **measure of mitochondrial genomes** reflected in the plasma or serum compartment and can indicate inflammation.
- Both biomarkers are indicative of mitochondrial damage which may lead to chronic adverse health conditions.

# Project 1

---

**Objective:** To determine the association between prenatal exposure to metals on two biomarkers of mtDNA in child blood: mtDNA<sub>Acn</sub> & cf-mtDNA<sub>Acn</sub>

**Goal:** to investigate the associations between maternal blood metals (Pb, Cd, Mn, Hg, Arsenic) measurements and mtDNA & cf-mtDNA biomarkers

# Project 1 Methods

Isolate & Clean DNA

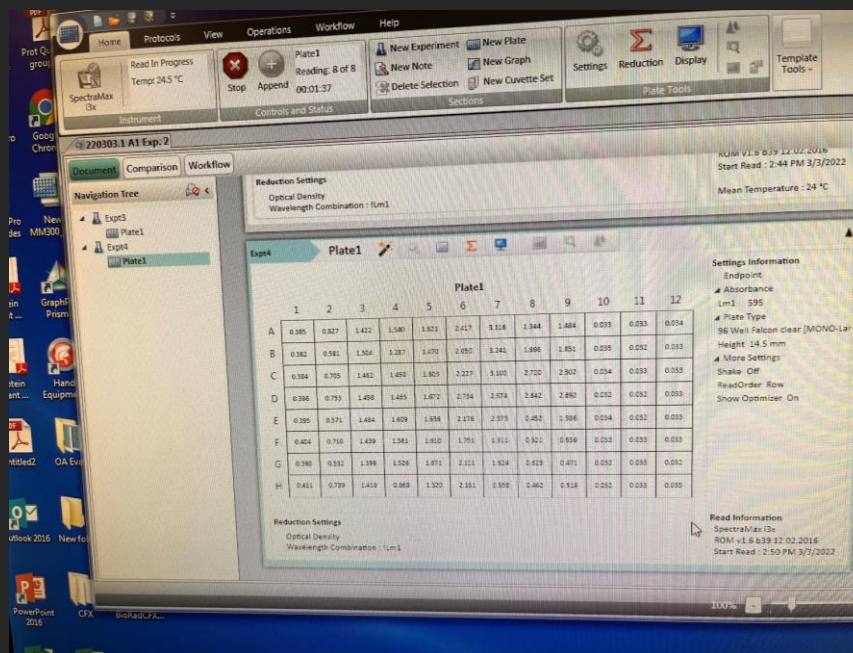

Dilute samples & make standards (Qubit)

Normalize samples & re-pico-green them (2ng/ul)

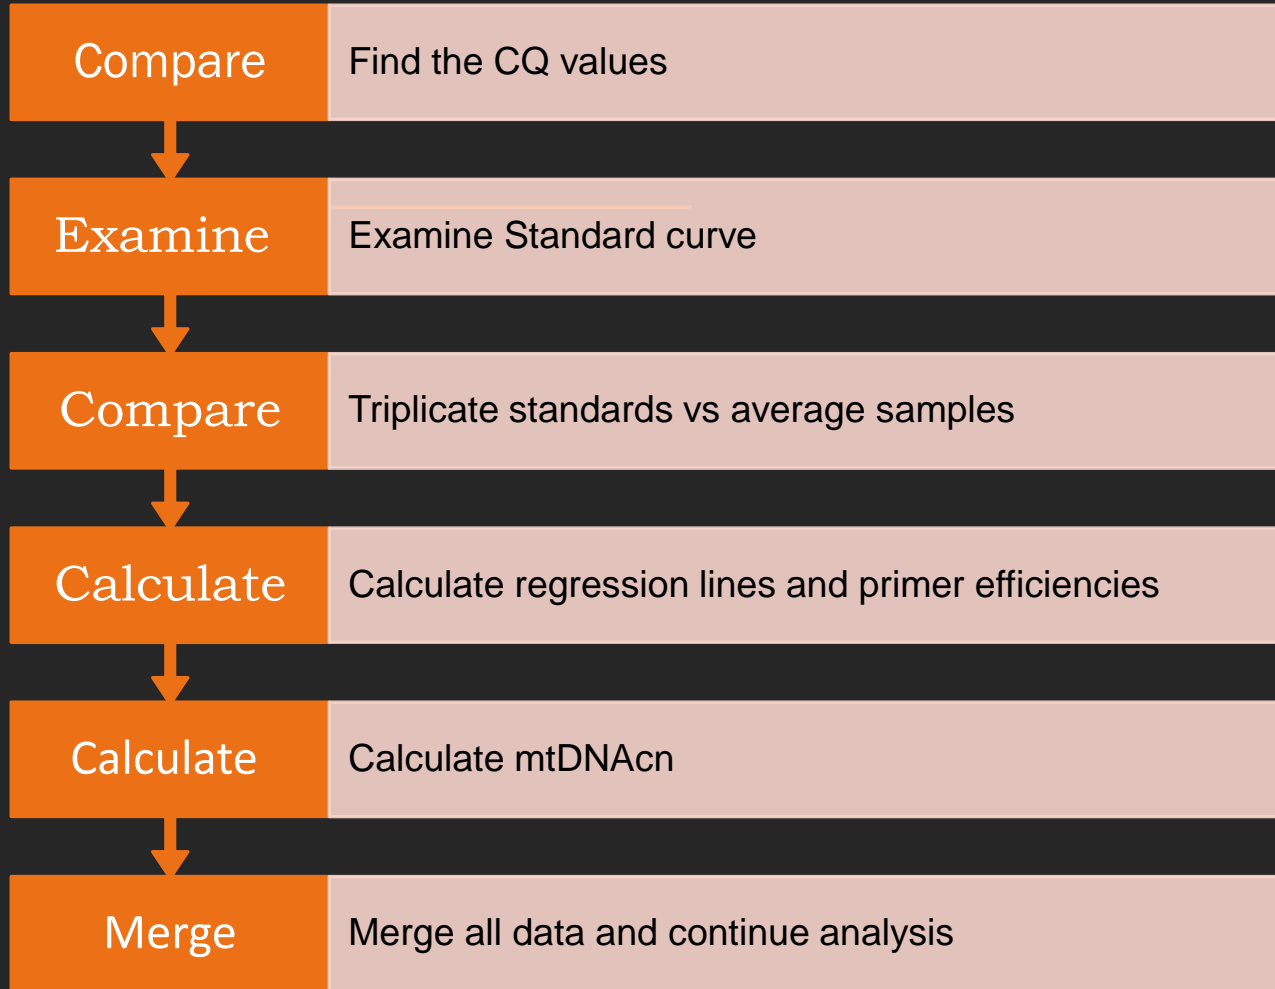

Use Pipetting Robot for 384 well plate

Perform mtDNA copy # assay

Perform Gel Electrophoresis

# R analysis

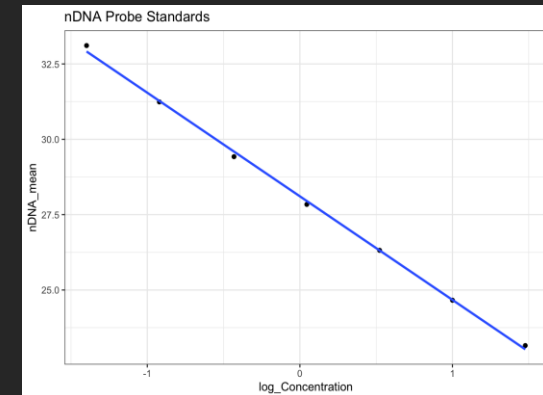

```
mtDNA Probe  
r.squared  
0.9970738  
  
kable(triplicates_stds %>%  
  do(glance(lm(nDNA_mean~log_Concentration, data = .))) %>% select(r.squared), caption = "nDNA Probe")  
  
nDNA Probe  
r.squared  
0.9987257
```

*Need values to be close to 1*

*MtDNA primer 100.8267*

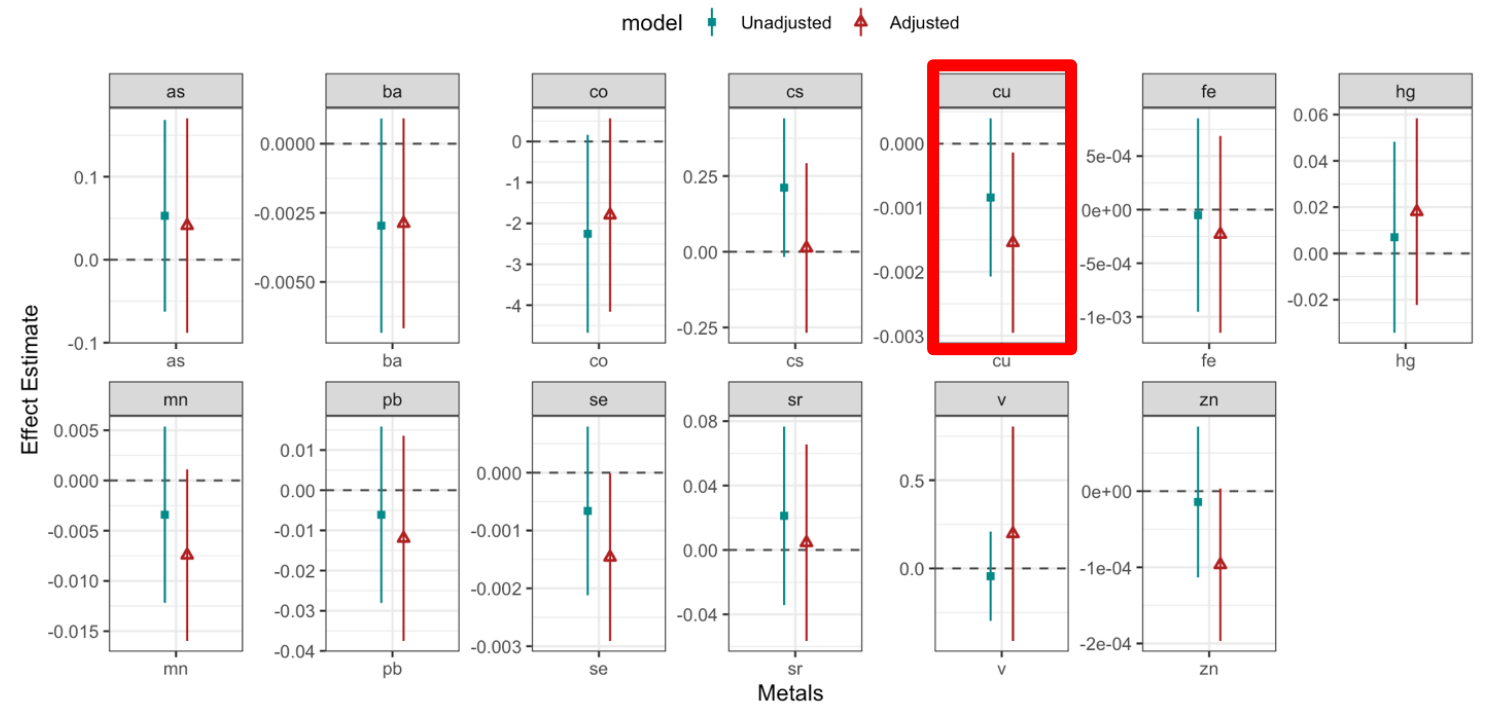

*nDNA primer 95.40516*

# Results

Figure 1: Forest plots for **Cellular mtDNA** and Metals as change in mtDNA per 1ug/L increase in metals

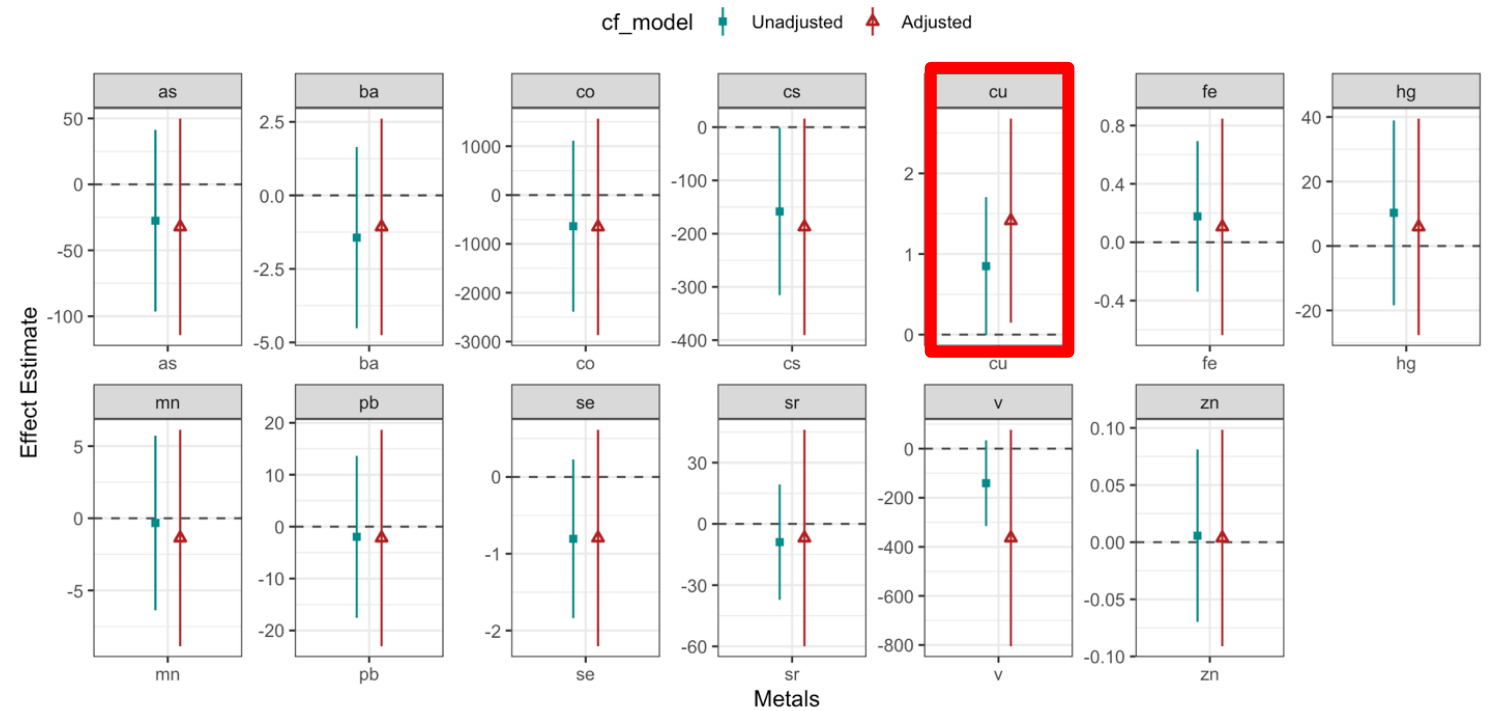

Effect estimate between cellular mtDNA and copper: -0.0015 (-0.003, -0.0001),  $p=0.03$

# Results

Figure 2: Forest plots for **Cell-Free mtDNA** and Metals as change in mtDNA per 1ug/L increase in metals

Effect estimate between cell-free mtDNA and copper: 1.41 (0.15, 2.68),  $p=0.03$

# Conclusions

---

Copper levels were significantly negatively associated with a reduction in cellular mtDNAcn and positively associated with cf-mtDNA.

Copper is an essential metal for child development, suggesting a complex relationship between prenatal copper and mitochondrial health.

No associations between mtDNA biomarkers and other metals were observed.
